Running a Checkpoint

Steps for checkpoint volunteers. Covers opening a checkpoint, marking off runners individually and in bulk, reviewing counts, exporting data, and transferring data to another device via QR code.

Marks off a single runner via the runner grid

A checkpoint volunteer clicks on a single runner's bib number tile in the grid to record that the runner passed through. The tile should change colour or appearance to make it obvious that runner has been marked as "through".

Checkpoint view — runner grid visible

Runner grid — tap first runner tile (200s range)

Marks off multiple runners via Quick Entry

Instead of finding runners in the grid, a volunteer can just type a bib number and press Enter to record it quickly. This test enters two bib numbers one after the other using the quick-entry shortcut and confirms both runners are marked off.

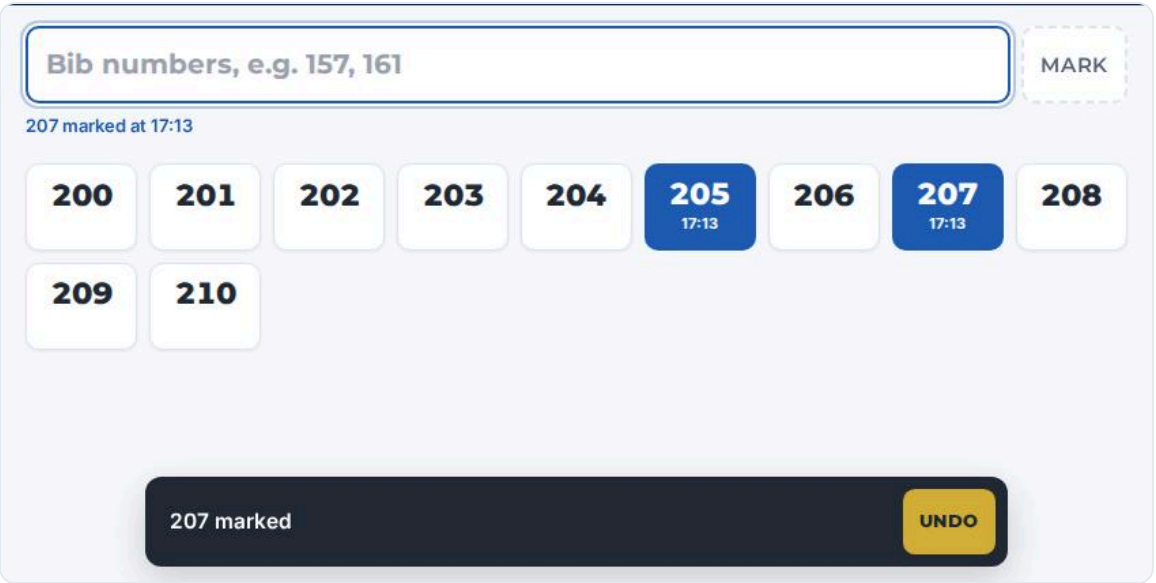

Checkpoint view — Quick Entry bar visible

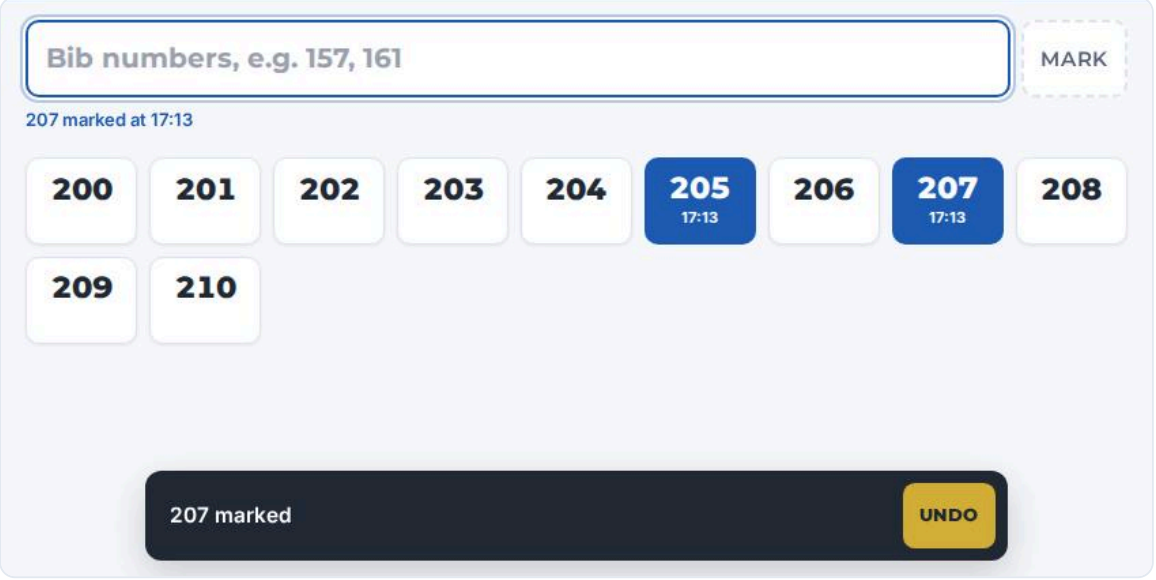

Quick Entry — type first bib number and press Enter

Quick Entry — type second bib number and press Enter

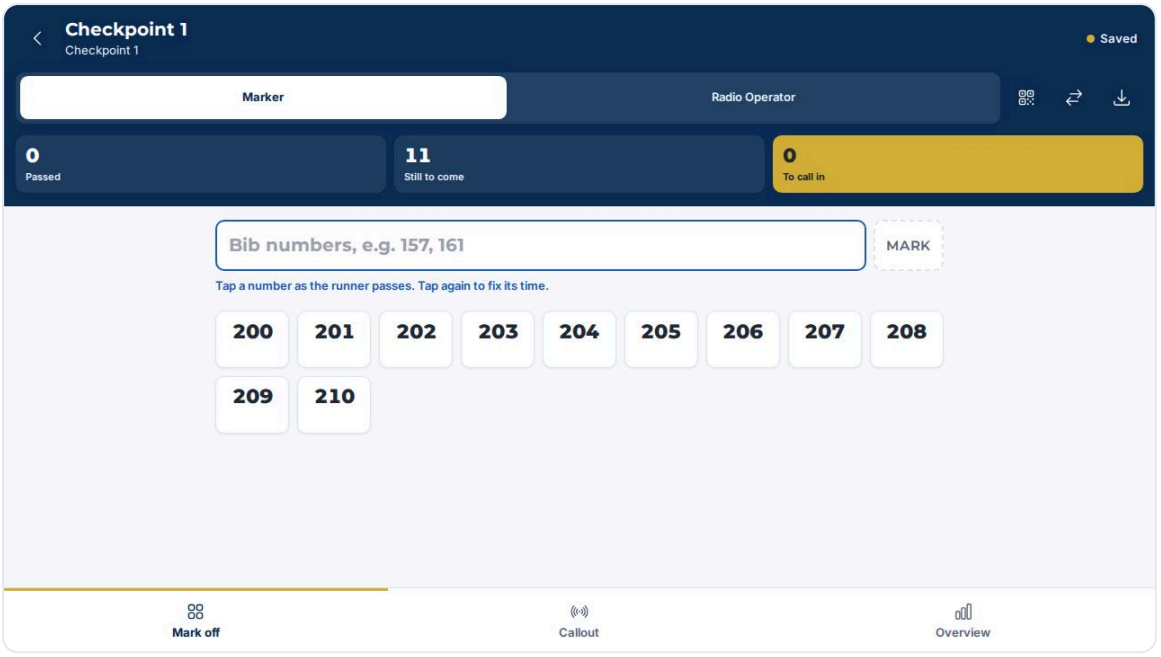

Runner grid — both runners marked off

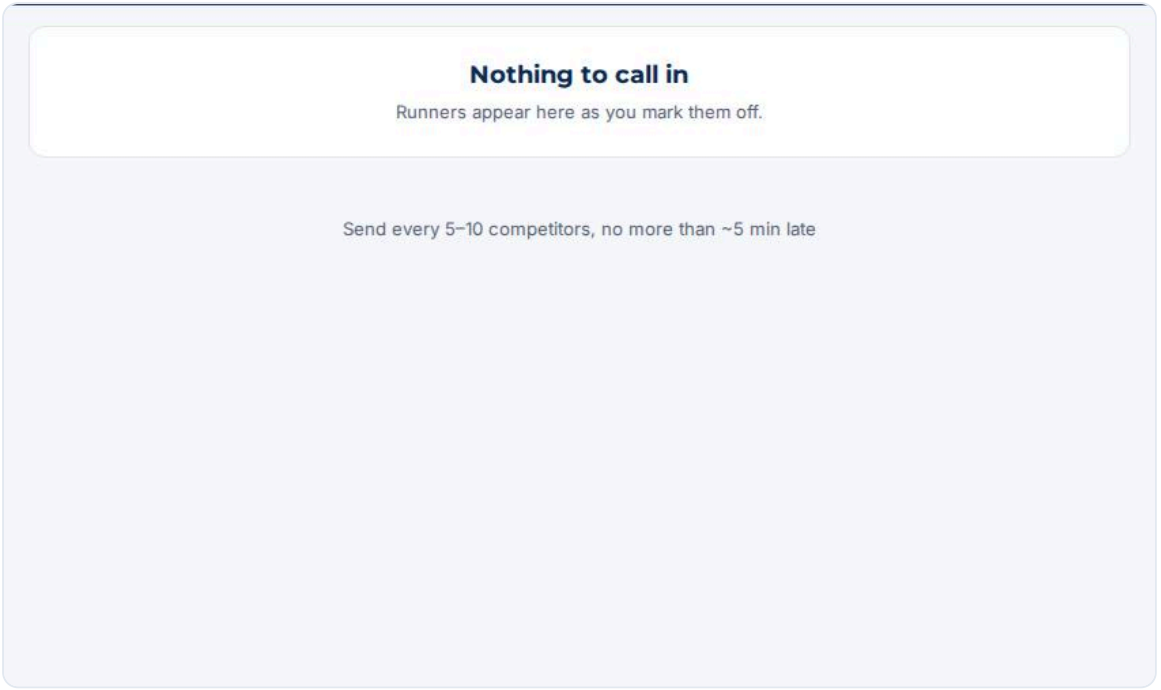

Switches to Callout Sheet tab

The Callout Sheet tab shows the list of runners who have not yet been recorded at this checkpoint. Volunteers read these numbers out over the radio to base station. This test checks the tab loads correctly and the list is visible.

Checkpoint view — Mark Off tab active

Callout Sheet tab — tap to switch

Callout Sheet — unrecorded runners listed

Nothing to call in

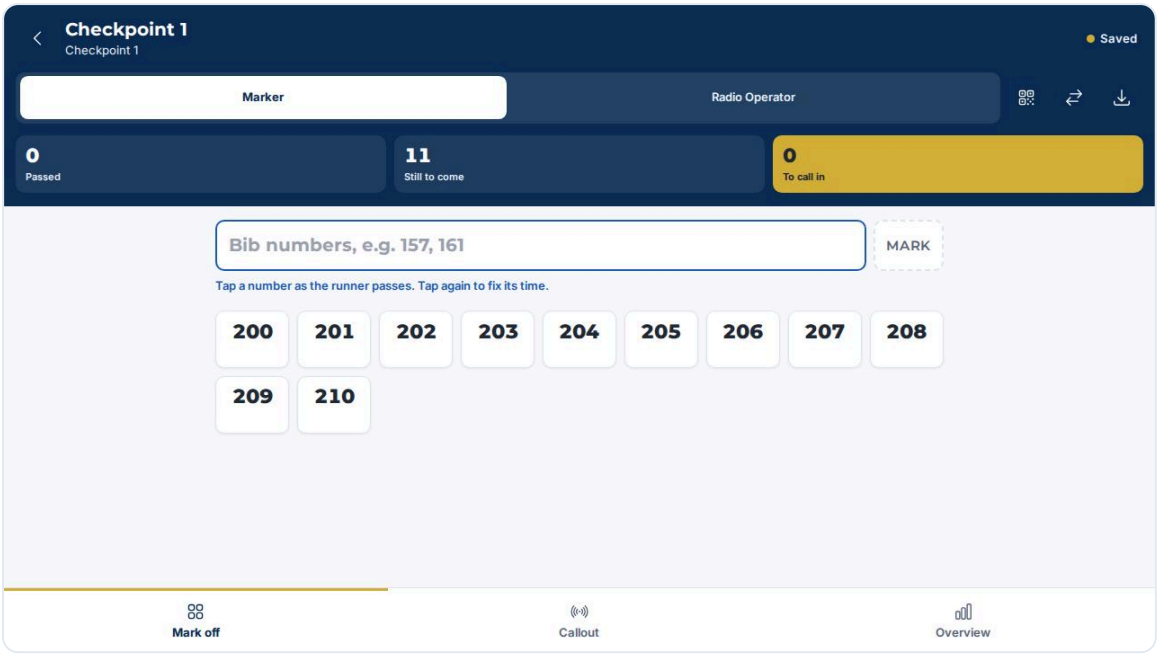

Runners appear here as you mark them off.

Send every 5–10 competitors, no more than ~5 min late

Switches to Overview tab and shows runner counts

The Overview tab shows a summary — how many runners have been through, how many are still expected, and other totals. This test confirms those summary numbers appear correctly when the tab is selected.

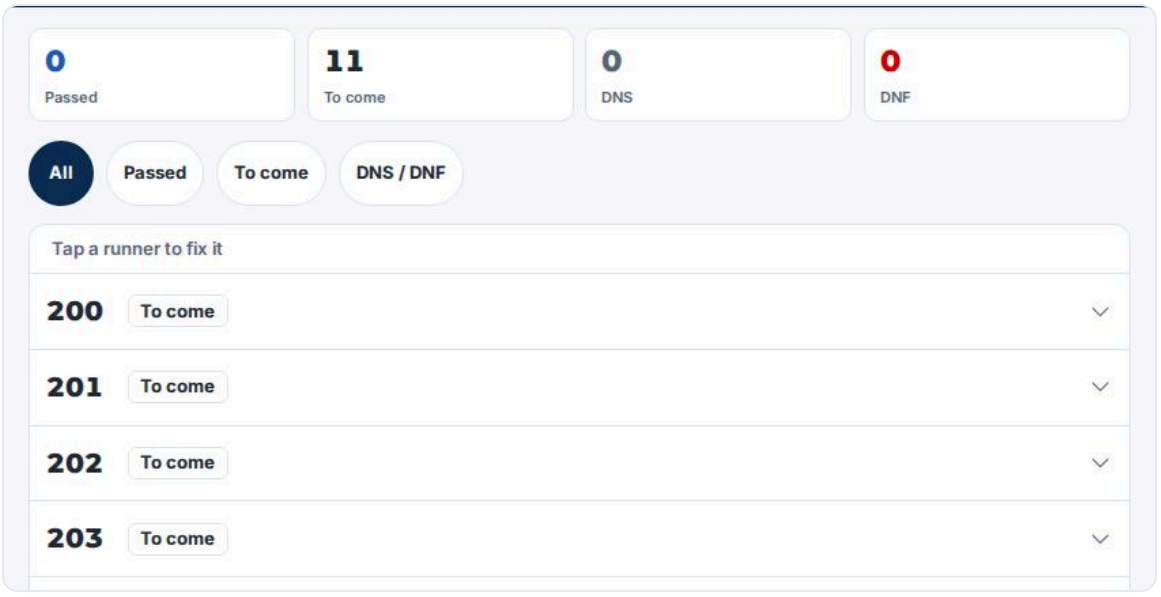

Checkpoint view — navigate to checkpoint

Overview tab — tap to switch

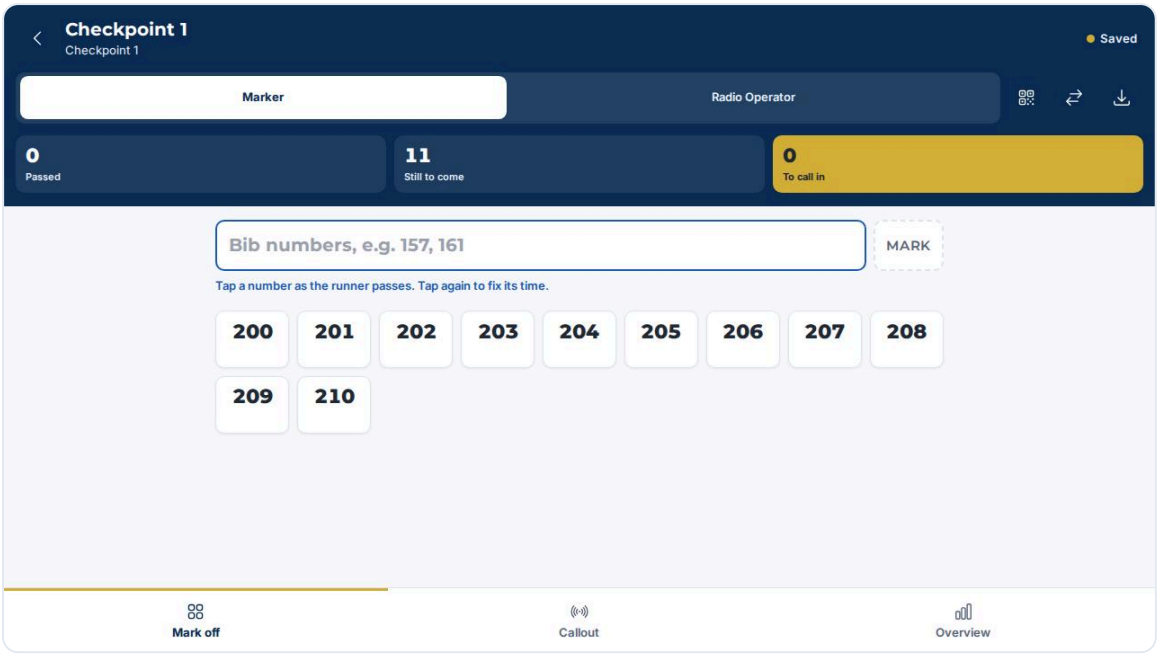

Overview — runner count summary visible

Can export checkpoint results

At the end of a checkpoint shift, a volunteer may need to export their recorded data to share with base station or keep as a backup. This test checks that the export option can be opened from the checkpoint screen.

Checkpoint view — navigate to checkpoint

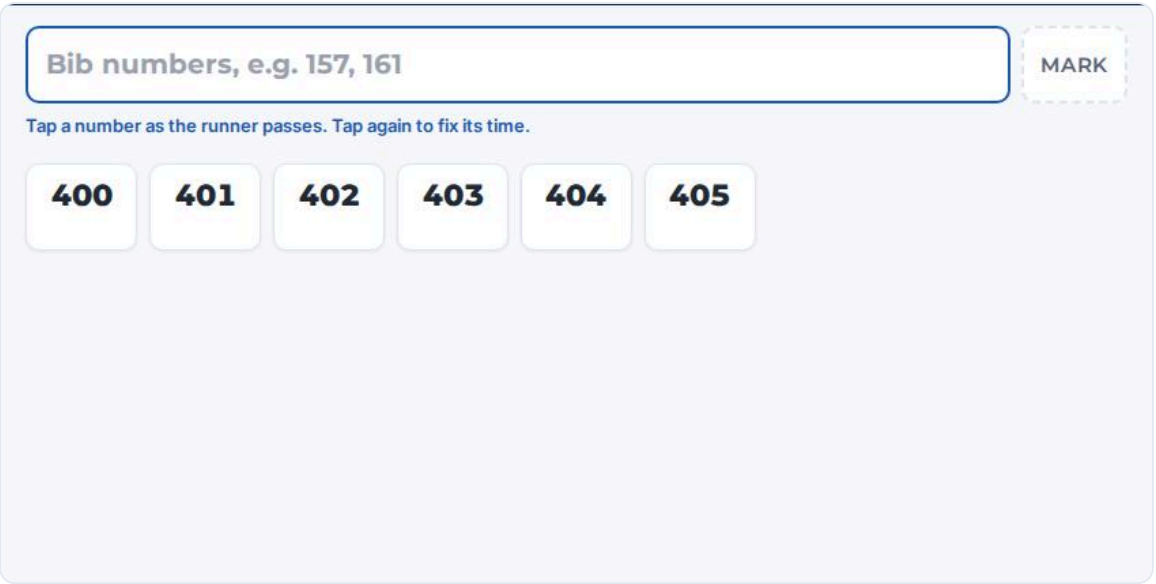

Export option — triggers JSON download

Navigates from race overview to a checkpoint

From the race overview, a race director can jump straight to any checkpoint's live mark-off screen. This test clicks the Checkpoint 1 link and confirms the checkpoint mark-off screen opens.

Checkpoint view — mark-off screen for CP1 open

Callout sheet tab shows runners who passed but not called in

The Callout Sheet tab lists all runners who have been marked as passed at the checkpoint but have not yet been confirmed as called in to base station. Checkpoint volunteers use this list to make radio calls.

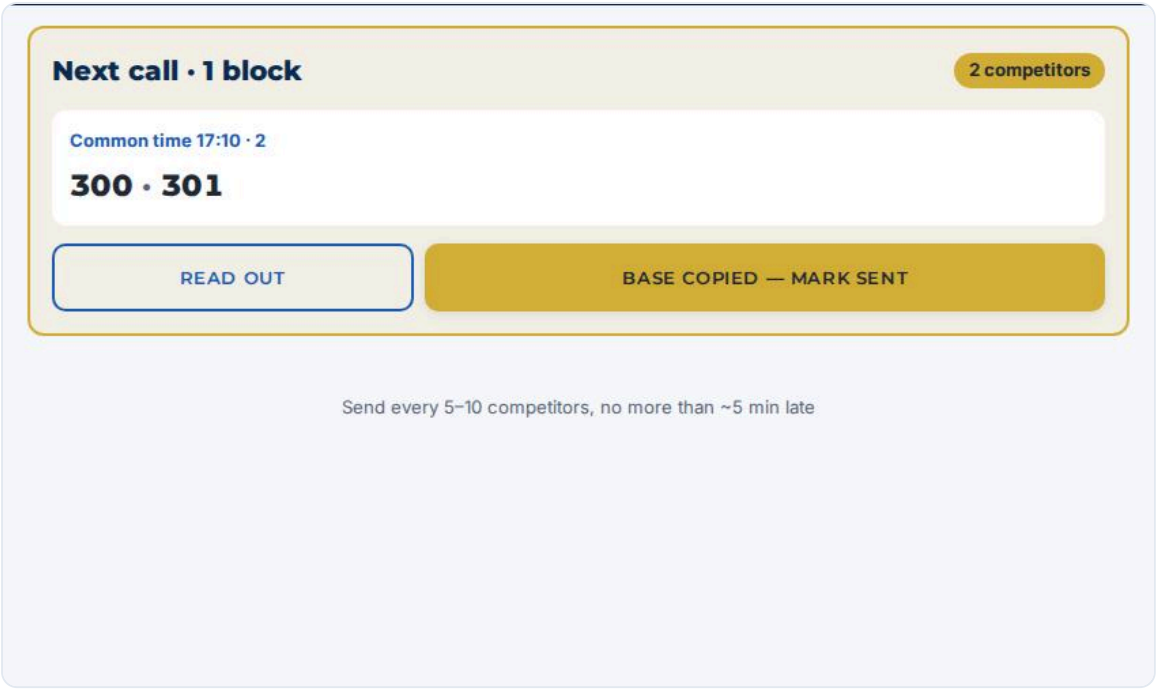

Mark Off tab — mark two runners as passed

Callout Sheet tab — click to switch

Callout Sheet — verify content is visible

BASE COPIED — MARK SENT
Send every 5–10 competitors, no more than ~5 min late

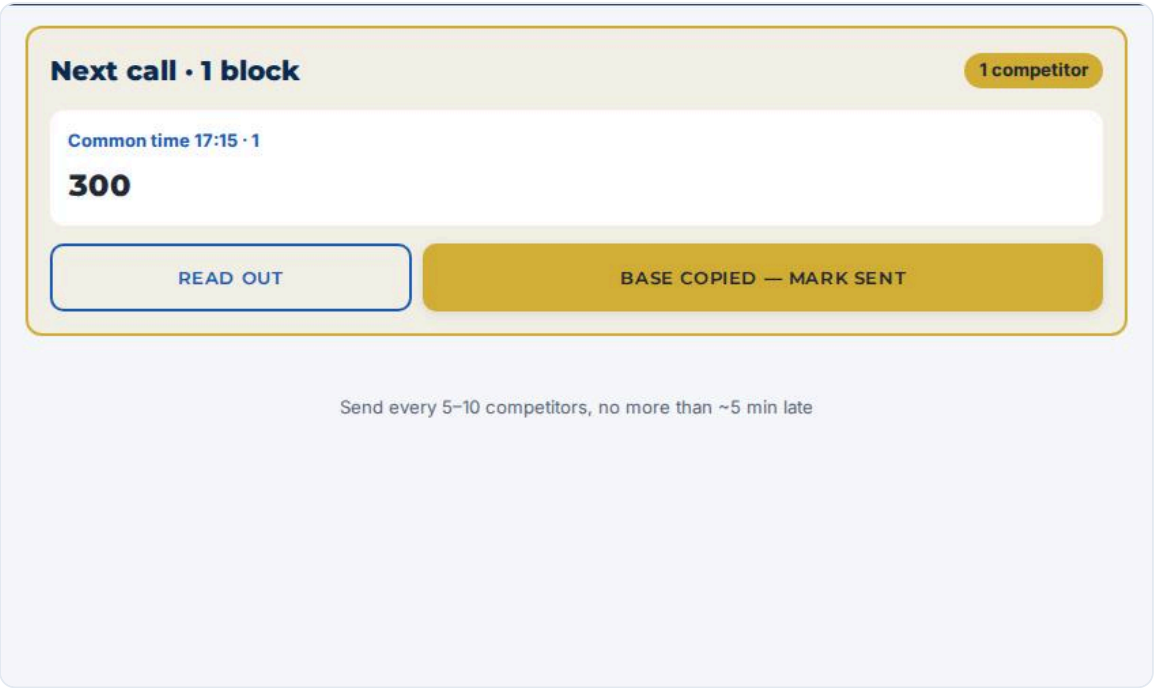

Pending count badge decrements when runner is called in

When a checkpoint volunteer marks a runner as called in, the pending count badge on the Callout Sheet tab decreases by one. If all runners have been called in the badge disappears.

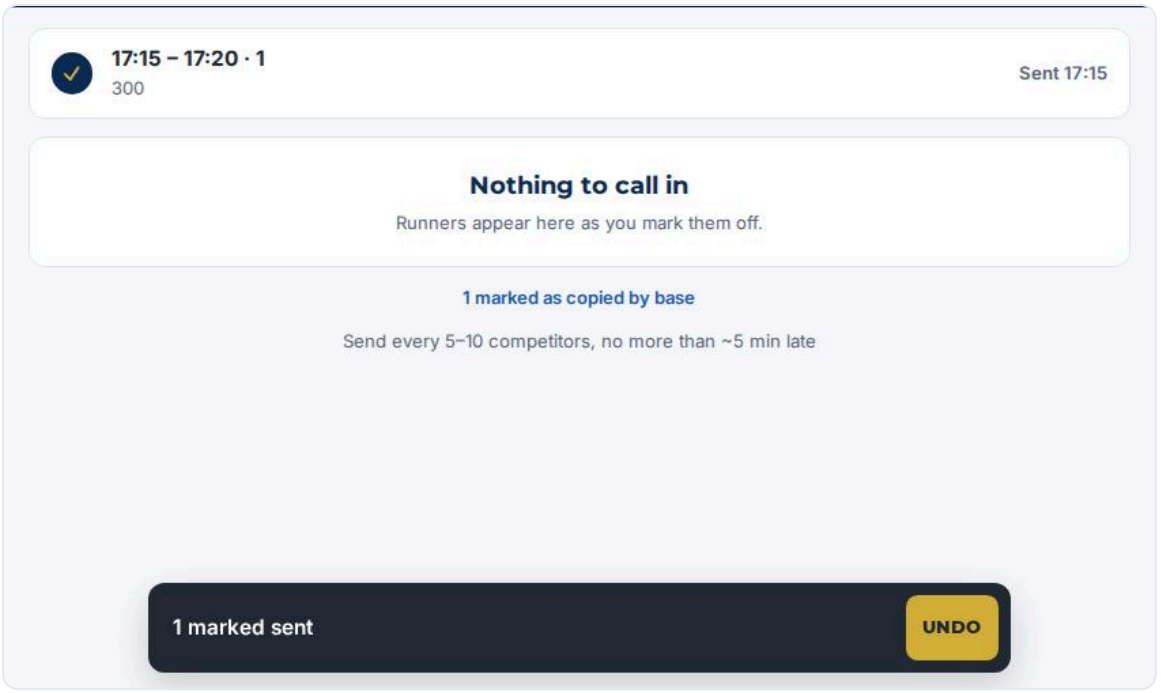

Mark Off tab — mark a runner to create a callout segment

Tab bar — check for pending count badge

Callout Sheet — Base copied — mark sent clears the pending call

Back button returns to the checkpoint view

Navigate to transfer route

Tap back button — returns to /checkpoint/1

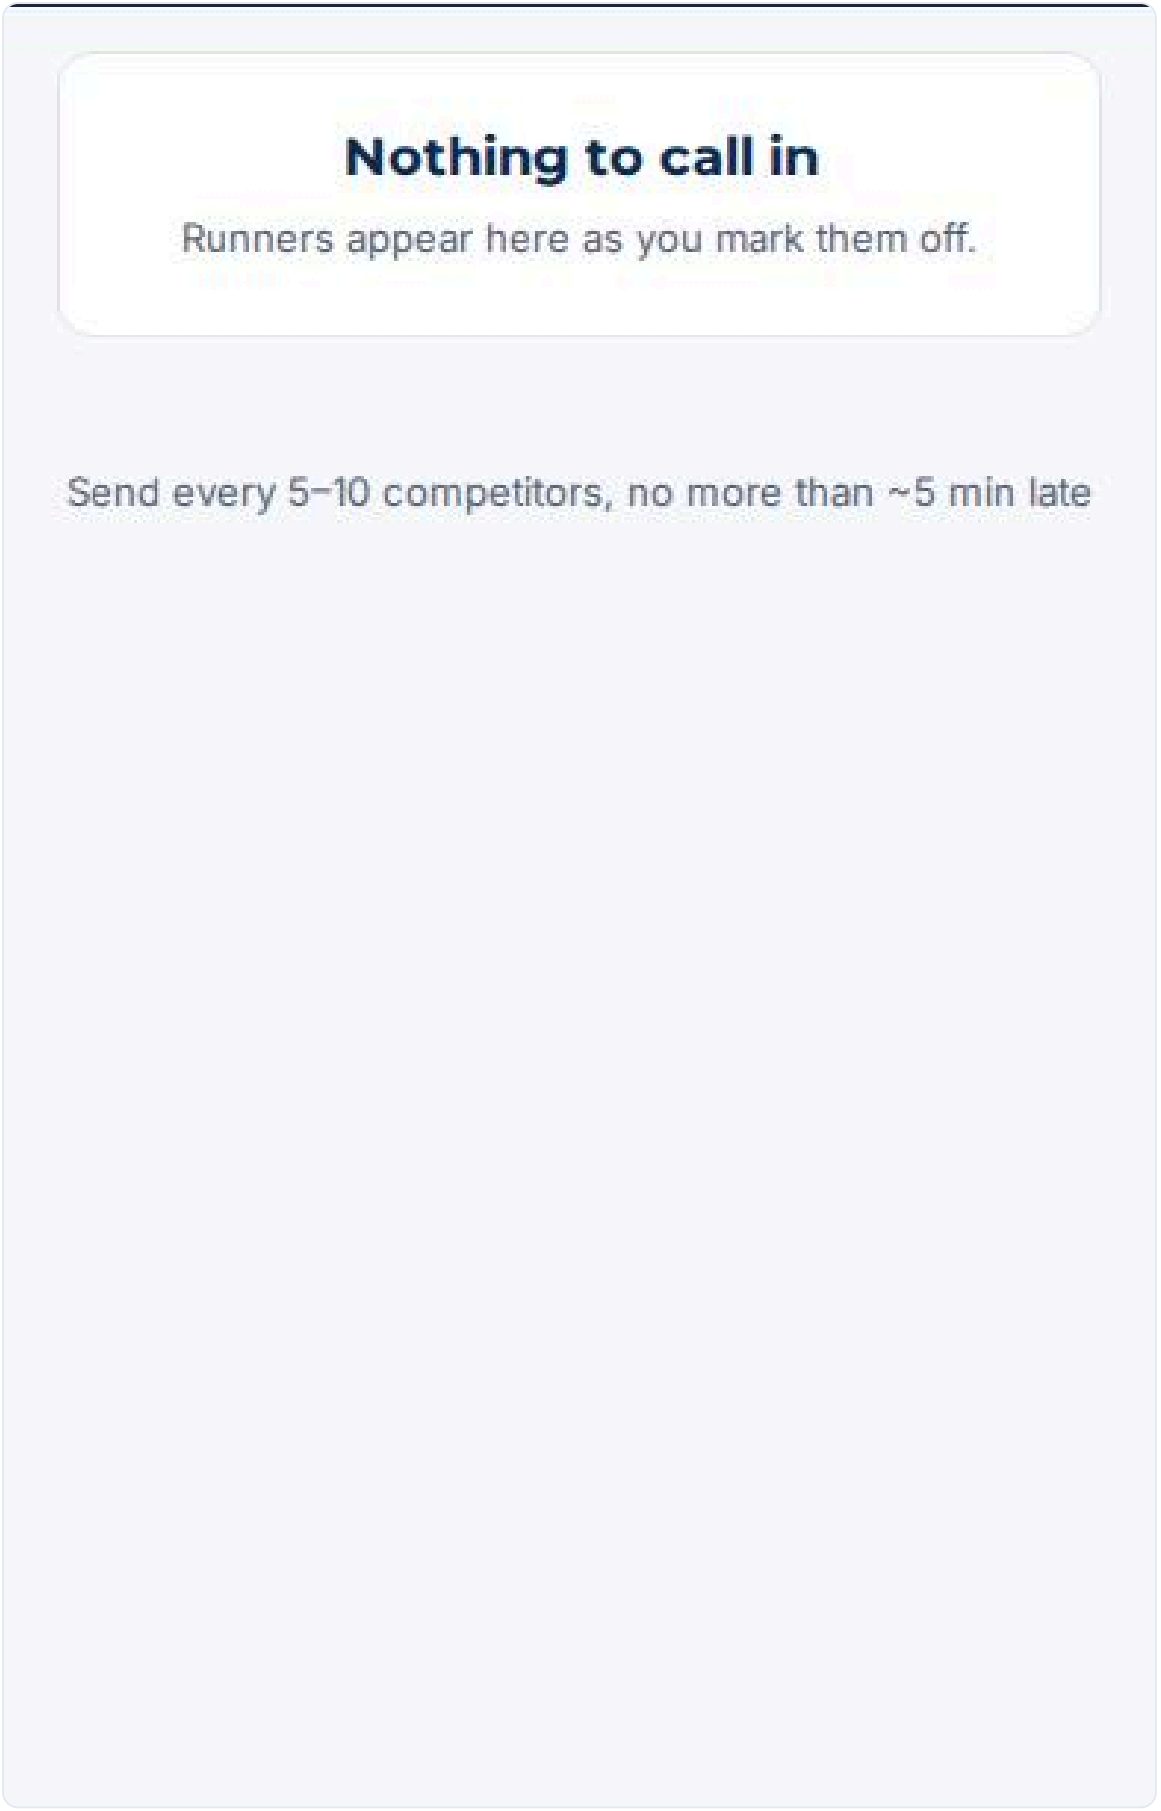

Header shows location and frequency in full

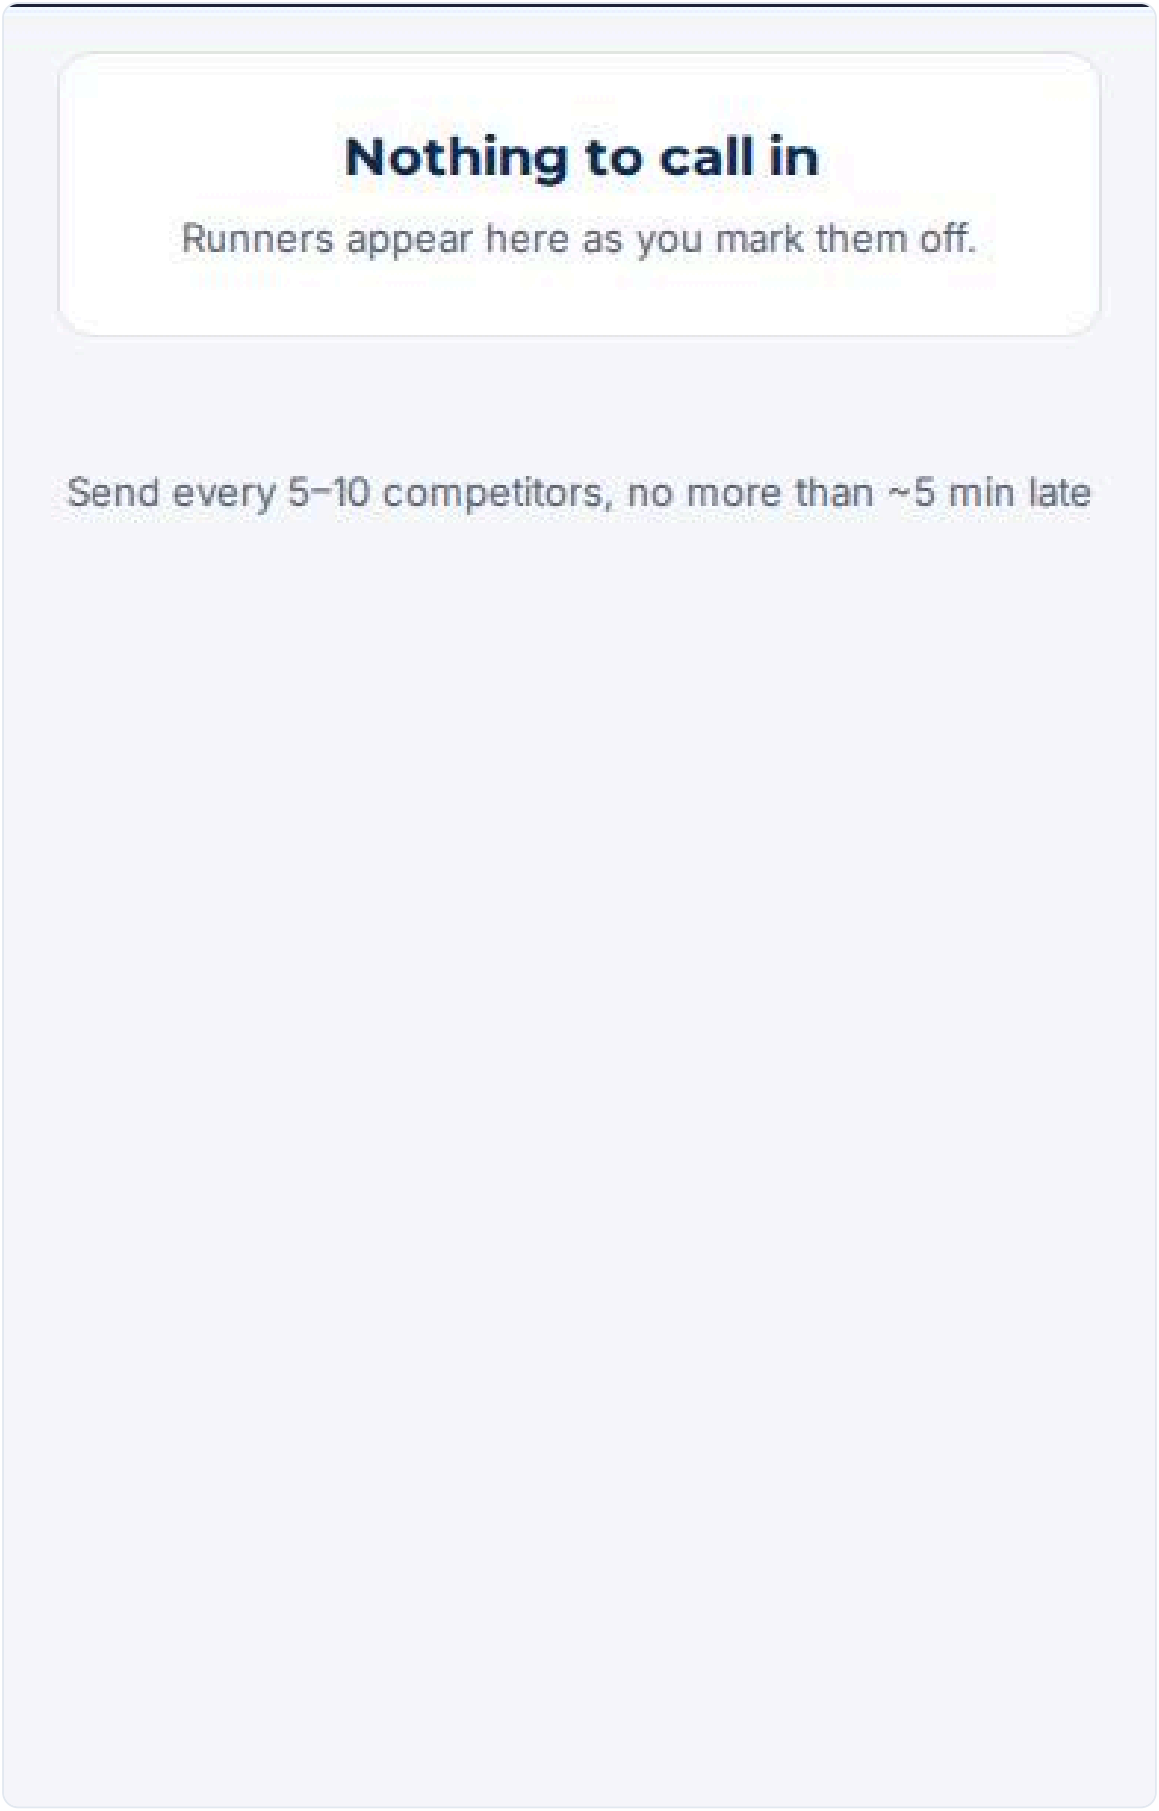

Mark off — the location wraps rather than cut off; no callsign

Callout — "CP3 · Callout" and the frequency 147.225; no callsigns

Callout — tracking only: no message or stand-down log

Overview — "CP3 · Overview"; the tap hint heads the list

Share batch lives in the app bar and covers no tiles

Five runners passed — Share batch shows the count in the app bar

Bottom-right tile 119 is clickable at 390 × 844

Status line stays in view while the grid scrolls

Scroll the grid to the bottom and tap a DNS runner — the message is on screen

Checkpoint marks a bib not in the setup

Quick entry 512 — marked, flagged "not in setup", in its own group

Callout — 512 is read like any other runner

A five-digit number asks first; Undo removes 512
