Navigating the App

How to move between modules, what to expect on the home screen, and how the app protects active operations from accidental navigation.

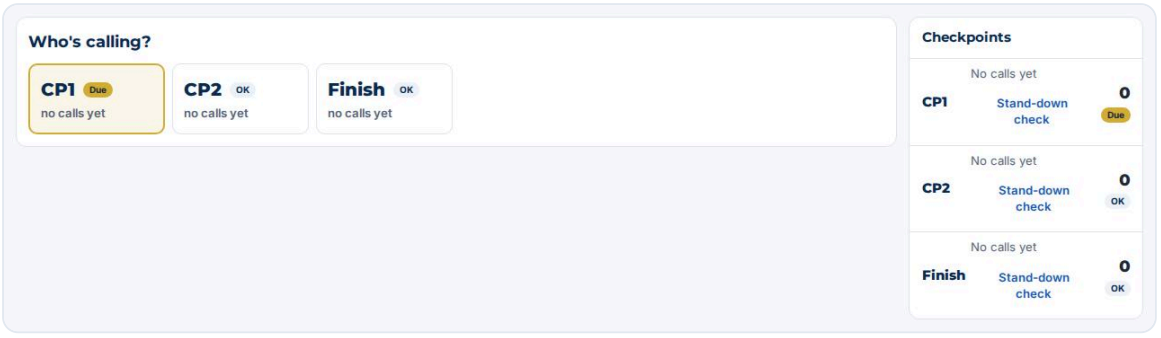

Navigates from race overview to base station

From the race overview, a race director can jump straight to the base station. This test clicks the Base Station button on the overview page and confirms the base station operations screen opens.

Navigate directly to base station operations

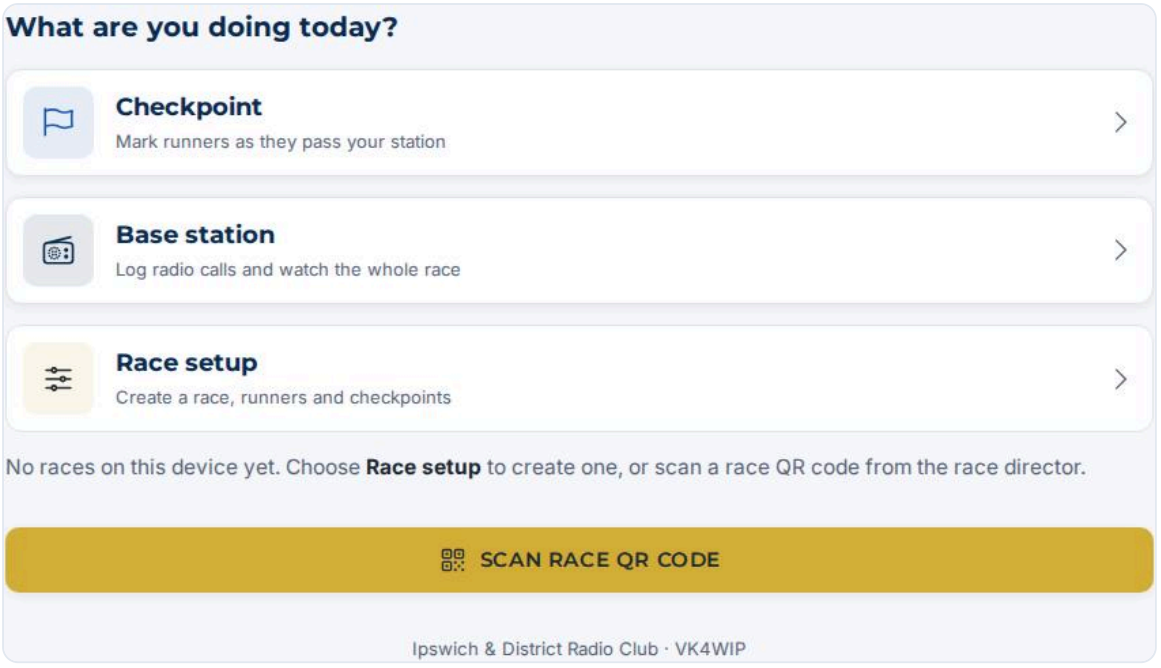

Base Station — operations screen open

Home page landing shows the race management module card

The Race Maintenance module card should always be visible on the home screen so race directors can always find it easily. This test simply confirms the card is present.

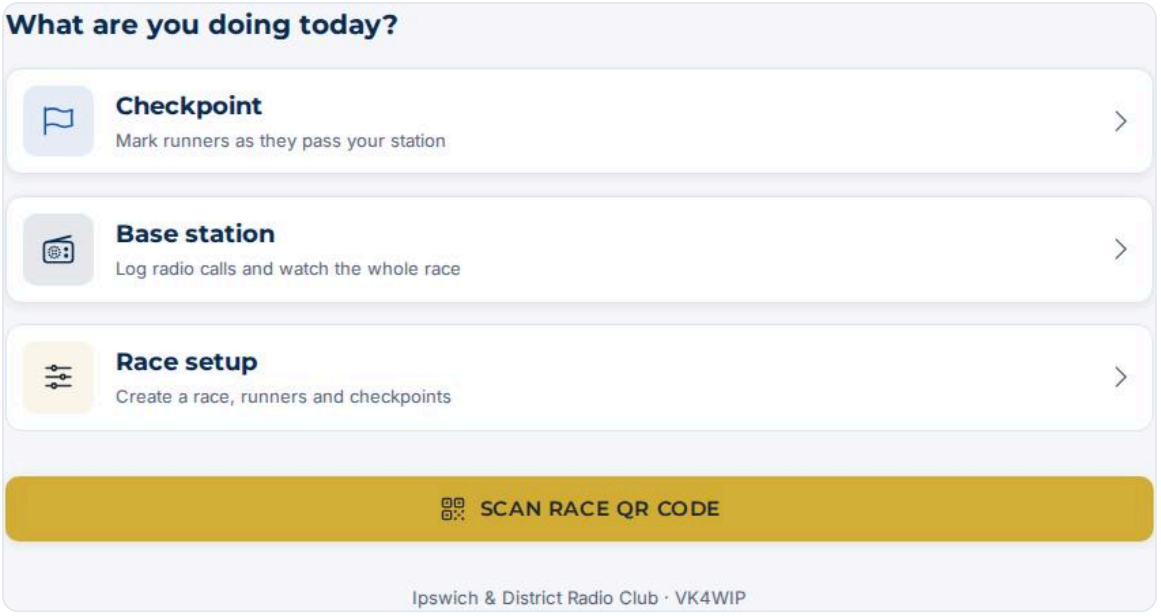

Home — Race Maintenance module card visible

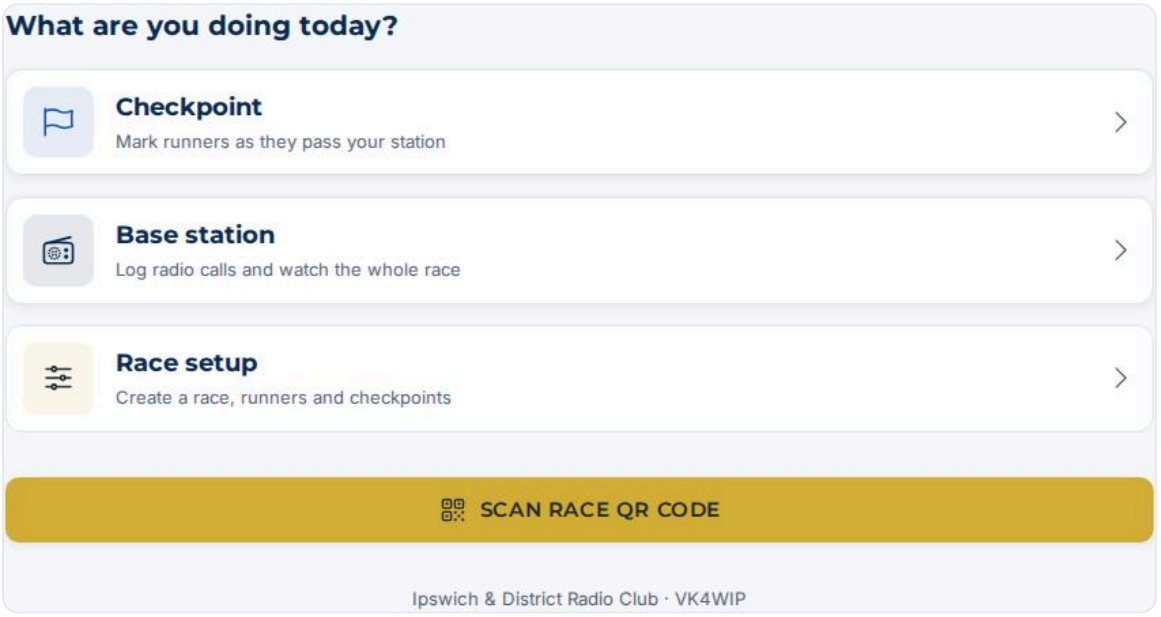

Shows protection modal when leaving active checkpoint operation

While a checkpoint volunteer is actively recording runners, the app should warn them if they try to navigate away — for example by tapping the back button or going to a different module. This prevents accidentally losing all their recorded data. This test triggers that navigation and confirms the warning appears.

Attempt navigation away — go to home /

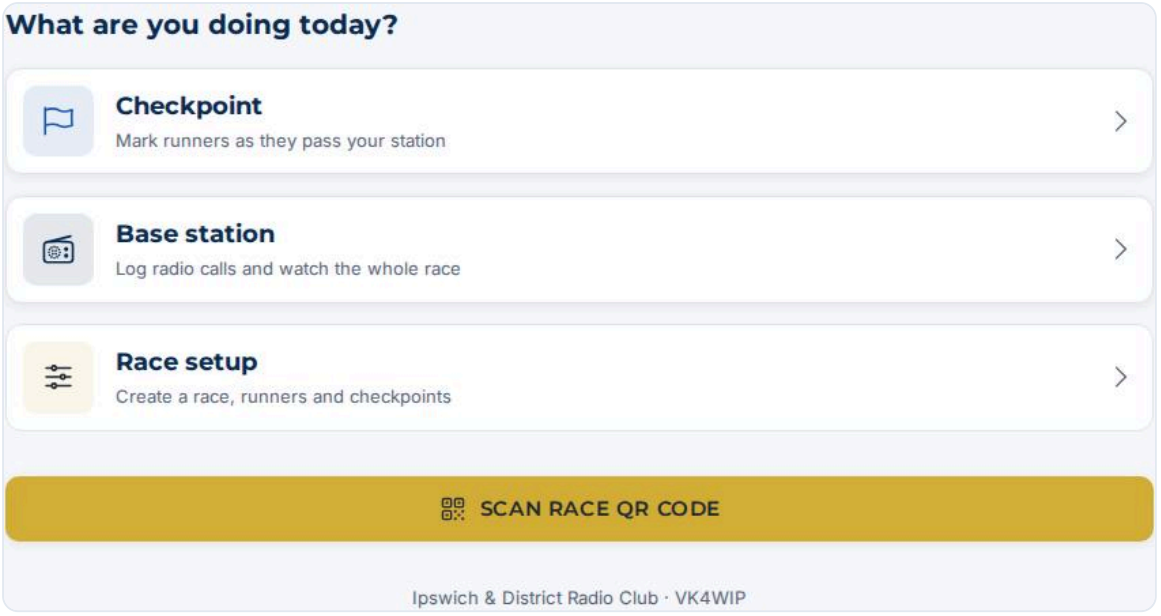

Protection modal — operation warning or graceful fallback

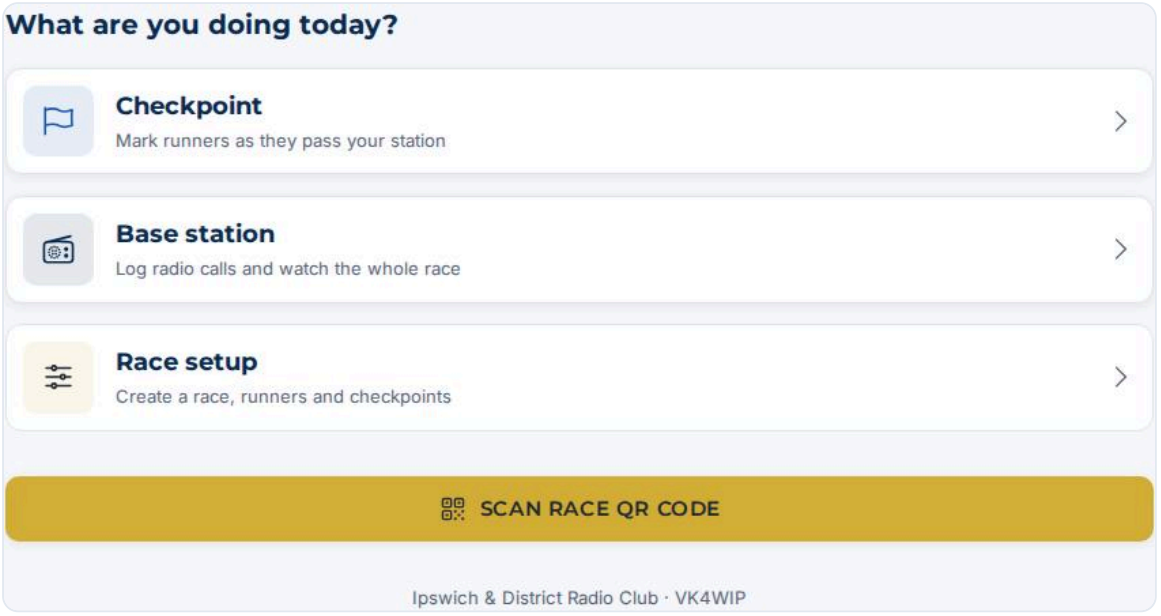

Allows navigation after confirming exit from active operation

If a volunteer sees the "you're about to leave an active session" warning and confirms they want to leave anyway, the app should let them go and return them to the home screen. This test confirms that confirming the exit actually works.

Confirm exit — trigger exit and accept confirmation

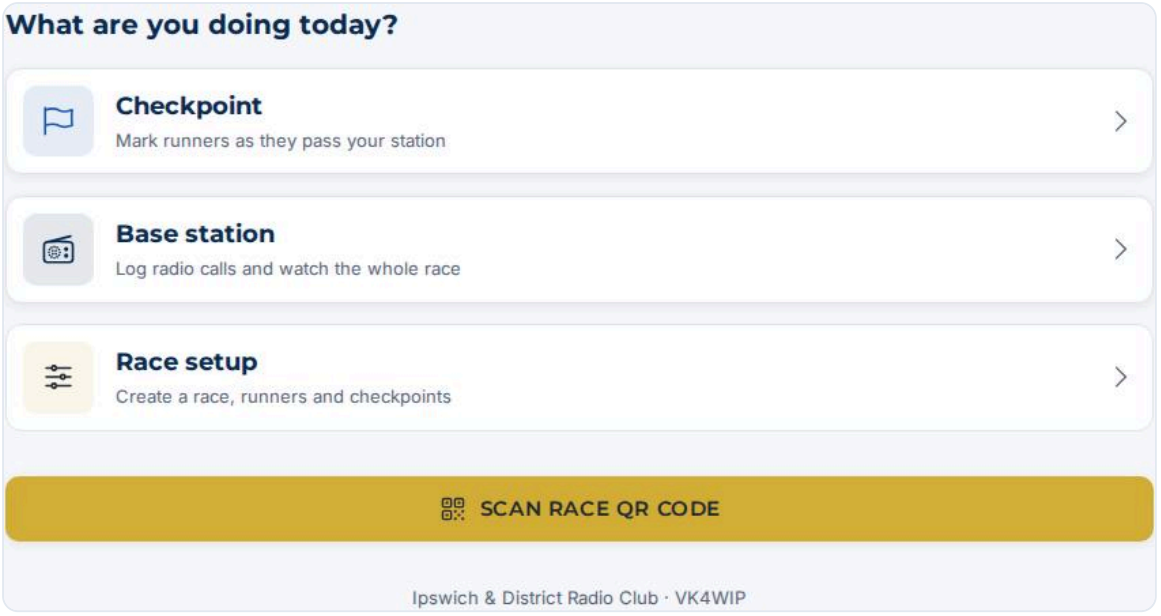

Navigation complete — landed on non-checkpoint route

Home page module cards are all accessible when no operation is active

When the app is idle on the home screen and no operation is in progress, all three module cards — Checkpoint Operations, Base Station, and Race Maintenance — should be enabled and ready to tap. This test confirms none of them are accidentally disabled.

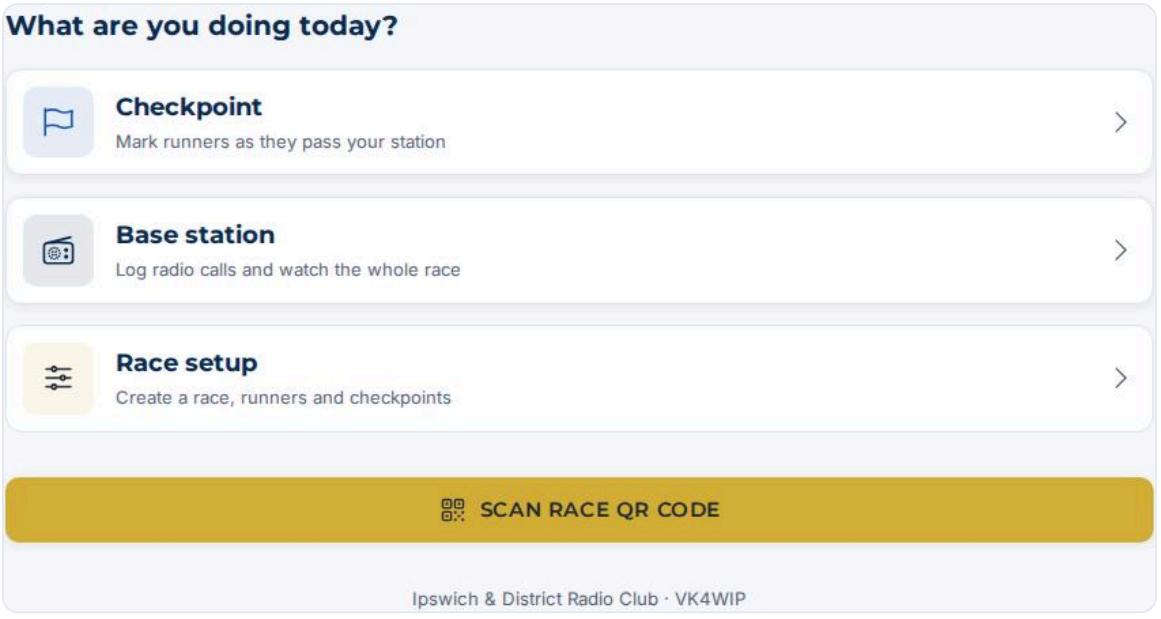

Home page — all module cards visible and enabled

Unknown routes redirect to home

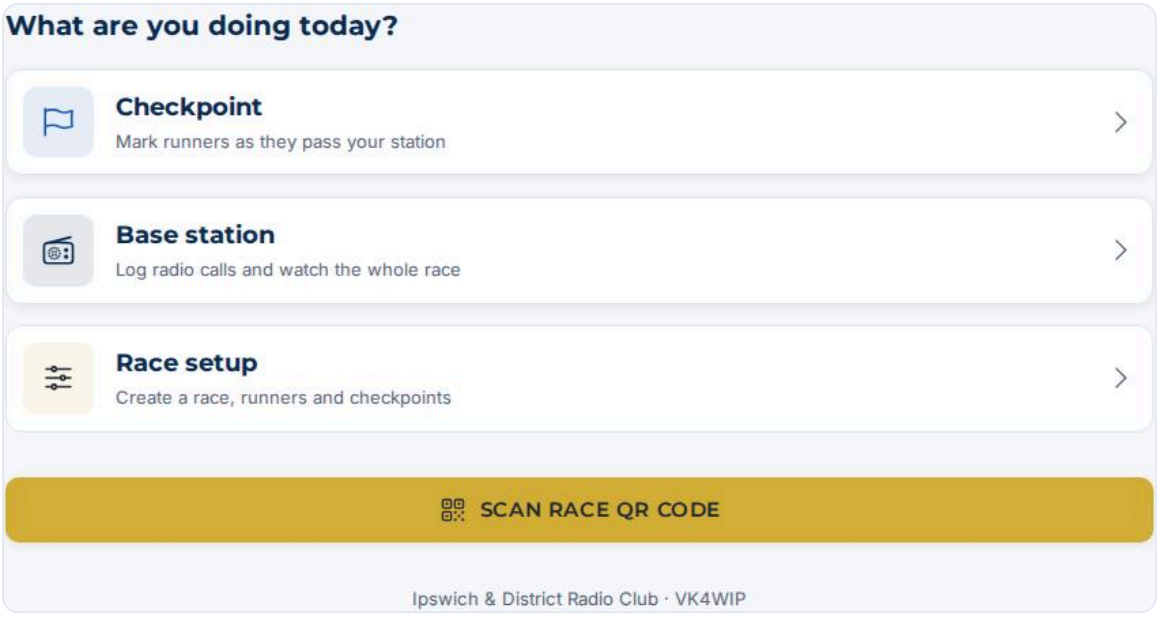

If someone types a web address that doesn't exist in the app (perhaps a typo or an old bookmark), they should be automatically sent to the home page rather than seeing a blank or broken screen.

Unknown route — redirects to home page

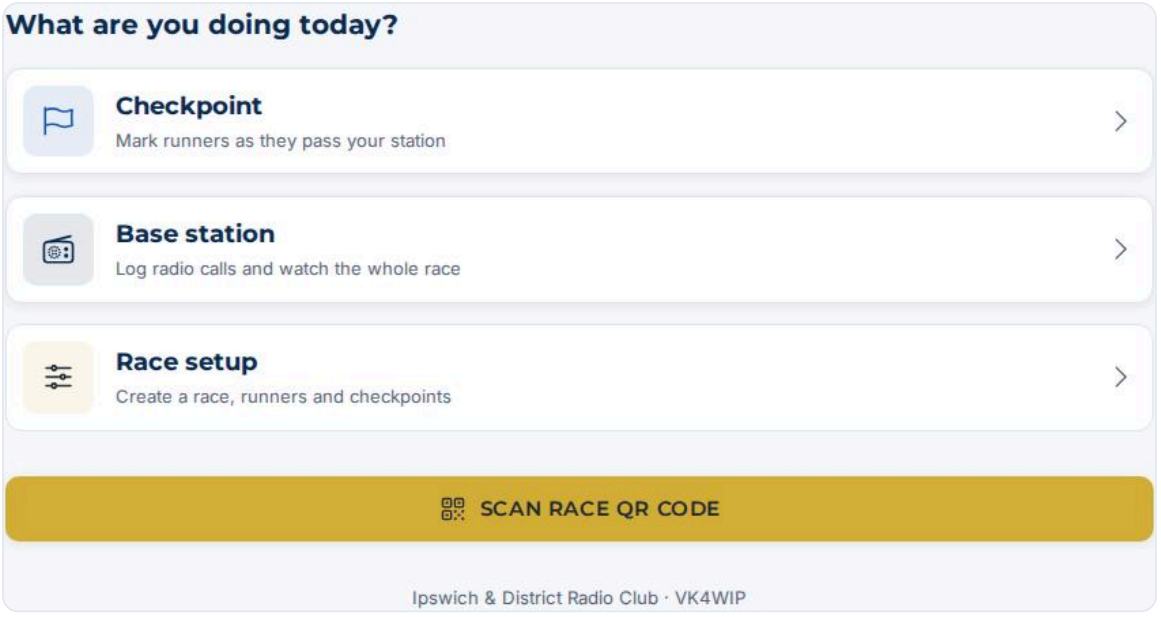

Home shows the three roles, the current race and Scan race QR code

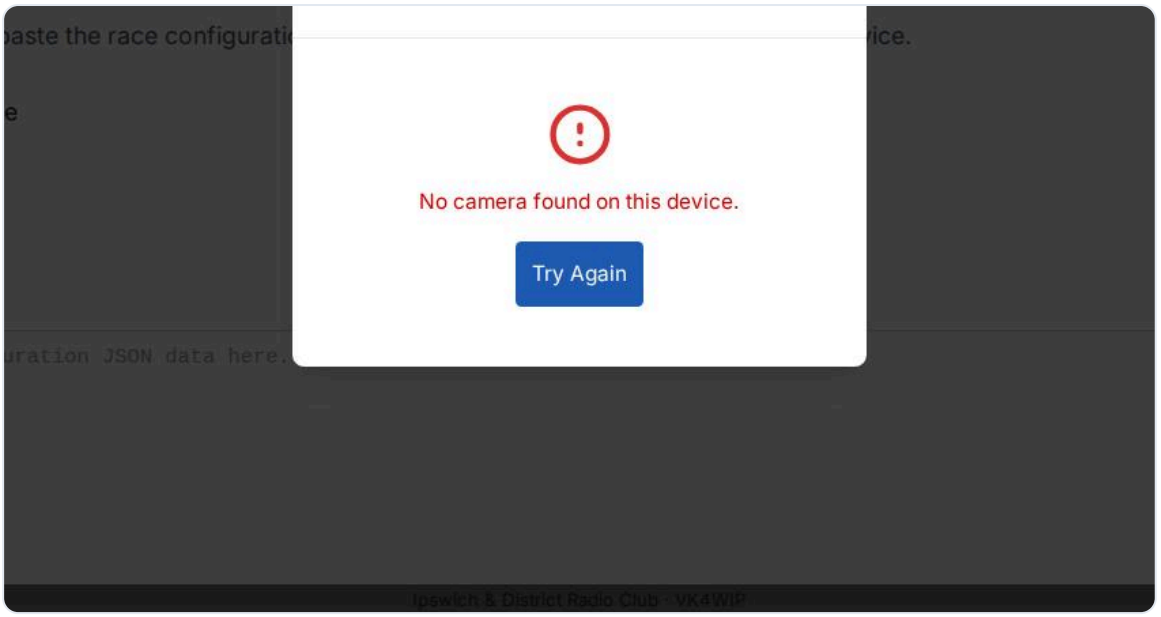

Home — choose your role: Checkpoint, Base station or Race setup

Current race card shows the race name, checkpoints and start time

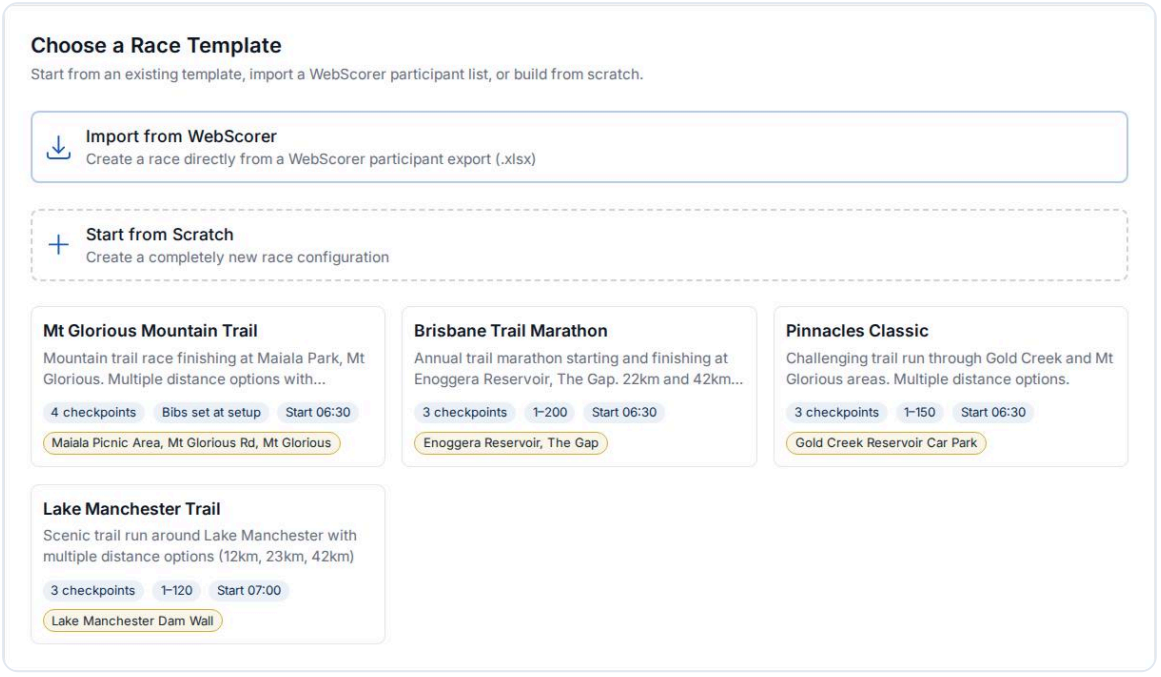

Scan race QR code opens the import screen

Footer names the club

Footer — "Ipswich & District Radio Club · VK4WIP"

Sheets trap focus and close on Escape

Tab around the edit sheet — focus never leaves it; Escape closes it

Status lines are polite live regions

Mark off, Receive, DNF / DNS and Reports status lines use aria-live="polite"

Undo bar clears itself after about six seconds

Unmark — Undo shows, then goes by itself
